NFR-1 - Every change is recorded

As a member of the endpoint maintenance team, I want every change to a service, endpoint, supplier or template recorded automatically, so that when something breaks I can always trace how it got that way.

- Any successful create, edit, rename, endpoint switch, status change, or supplier add/remove produces an audit entry - no action changes data without leaving a record.
- If a change fails, no misleading entry is written.
- Recording is automatic - I never have to remember to log anything.

NFR-2 - Each entry says who, what, when

As a team member investigating an issue, I want each entry to show who made the change, from which organisation, and exactly when, so that I can hold the right person/org accountable and ask the right questions.

- Entry shows: user that made the change, org/ODS code, timestamp, the service/endpoint/supplier affected, and the change type (created / updated / renamed / status-changed / deleted).
- Timestamps are also shown in readable local time, not just raw UTC.

NFR-3 - Before-and-after values

As a team member fixing a bad change, I want to see what a value was before and after, so that I can understand or reverse it without guessing.

- For an edit, the entry shows old → new for the fields that actually changed (e.g. endpoint URL, status, service name, supplier).
- For a delete, it shows the last state before deletion.

NFR-4 - I can search history the same way I search everything else

As a team member, I want to search change history by ODS code, service name, endpoint and date.

- History is searchable by ODS code, service name (including partial matches), endpoint id/URL, status, org, and date range.

NFR-5-The history is trustworthy

As a team member relying on the trail to diagnose problems, I want it to be complete and tamper-proof, so that I can trust what it tells me.

- No way in the tool to alter or delete a past entry.
- The same change always produces exactly one entry -no duplicates, no gaps.
- Entries stay retrievable for 1 year.

NFR-6 - Drill-down is quick

As a team member, I want to get from a service to its endpoints, suppliers and history in a click or two, so that I'm not constantly re-searching.

- From a found service I can reach its endpoints, suppliers and change history without starting a new search.

NFR-7 - Errors are clear and actionable

As a team member, I want failures to tell me what went wrong and give me a reference I can quote, so that I can fix it myself or hand support something useful.

- Failures show a plain-language message and the specific field/value at fault.
- Every error carries a copyable reference/correlation id that ties back to the logs.
- I'm never left with a blank screen, raw stack trace or unhelpful error message.

NFR-8 - Stays responsive as it replaces other tools

As a team member, I want performance to hold as the tool takes on more services and users, so that expanding scope doesn't make my day-to-day slower.

- The current tools search feature doesn't always respond to searches.
- Planned scope expansion doesn't degrade lookup times.
- Any scheduled downtime is communicated in advance and kept outside working hours.

NFR-9 - My team and I see current, consistent data

As a team member working alongside colleagues, I want a change to show up promptly for everyone, so that two of us don't act on stale information.

- A change one person makes is visible to others within a few seconds.
- History reflects the true order in which changes happened.
